

Add-It® and Green Machine Pro® Proportioning Fertilizer Injectors

Fertilizing is not the labor intensive task it used to be. Add-It® and Green Machine Pro® are preset fertilizer injectors that will apply fertilizer *proportionately* and *evenly* throughout a drip/sub-surface or conventional sprinkler irrigation system with no pressure loss and no moving parts to wear out. Fertilize automatically without cumbersome spreaders or hose-end applicators, most of which are not proportioning at all. Simply let Add-It® and Green Machine Pro® fertilizer injectors do all the work for you!

It's easy to see why Add-It® and Green Machine Pro® automatic proportioning fertilizer injectors are ideal for many applications in the agricultural, commercial, greenhouse, golf course, and residential areas! Feed lawns, gardens, shrubs, trees, vineyards, groves, and potted plants easily without spreaders or hoses. No pump or outside power source is required.

As an added benefit, Add-It® and Green Machine Pro® have been designed for use with any brand of liquid fertilizer on the market today, and can also be used with totally water-soluble dry fertilizers like Scotts Miracle Gro® or Peters Professional®, Bandini Pro Choice®, or Grow More® when premixed with water at a ratio of one pound of dry additive to one gallon of water. You can double the amount of dry additive being placed into solution in spring, when you're trying to replace all the nutrients the winter rains have leached out of the soil.

Over many years, tests have concluded that applying liquid fertilizer on a regular basis is much more beneficial to a plant than being fed infrequently with a dry, granular form of fertilizer. Liquid fertilizer is absorbed far more easily by a plants root system, and there are no left over residues or minerals that can, over a period of prolonged use, damage a plant or lawn. You can also add a wetting agent to help breakup compacted soils, micro-nutrients and Vitamin Institute's SUPERthrive™ containing vitamins and hormones for healthier plants, and Vitamin B-1 when transplanting trees and shrubs.

Why is liquid fertilizer recommended? Because studies have shown that all fertilizers *must* be in liquid form before they can be absorbed by plants. The properties of liquid fertilizers are far different from dry forms (such as time-release pellets) by the manner in which they move through the soil and become available to plants or grass. Liquid fertilizer (which includes water-soluble fertilizer that has been premixed with water) is faster and superior to dry forms when applied in frequent, small amounts. This enables plants to absorb the nutrients before they are washed away. This also means that there are no stress periods of high and low levels of fertilizer which inhibit growth, and no leaching can take place by over watering, which might contaminate natural waters.

**Fertigation....the only easy, economical, and efficient way to apply
fertilizer as you irrigate with a drip/sub-surface
Or conventional sprinkler irrigation system!**
